

BEN BRENNMAN STORMWATER POND AQUATIC FEATURES

This tour highlights how the forebay, weir walls, aquatic features, and upflow gravel filter all work together to help reduce water pollution.

The City chose special features that are specifically designed to maximize pollution removal.

There are three **floating wetlands** whose plants are excellent at absorbing pollutants, helping to clean the water.

The **aerator fountain** adds oxygen to keep the water healthy for the fish and plants.

The City provides special care to these features to keep them healthy and functioning.

What's under the water?

The **aquatic bench** is located around the entire perimeter of the pond and houses several species/varieties of aquatic plants. In addition to providing habitat for wildlife, the **aquatic bench** helps to reduce erosion and excess sediment entering the pond.
